Tidy Data with

Number of children by year and gender

Can we calculate the ratio of boys to girls?

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

```
year
           sex
      <dbl> <chr> <int>
       1880 F 90993
       1880
           M 110491
       1881 F 91954
                M 100745
       1882
                  107850
       1882
                M 113688
CC by RSt 6io
```

Can we calculate the ratio of boys to girls?

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

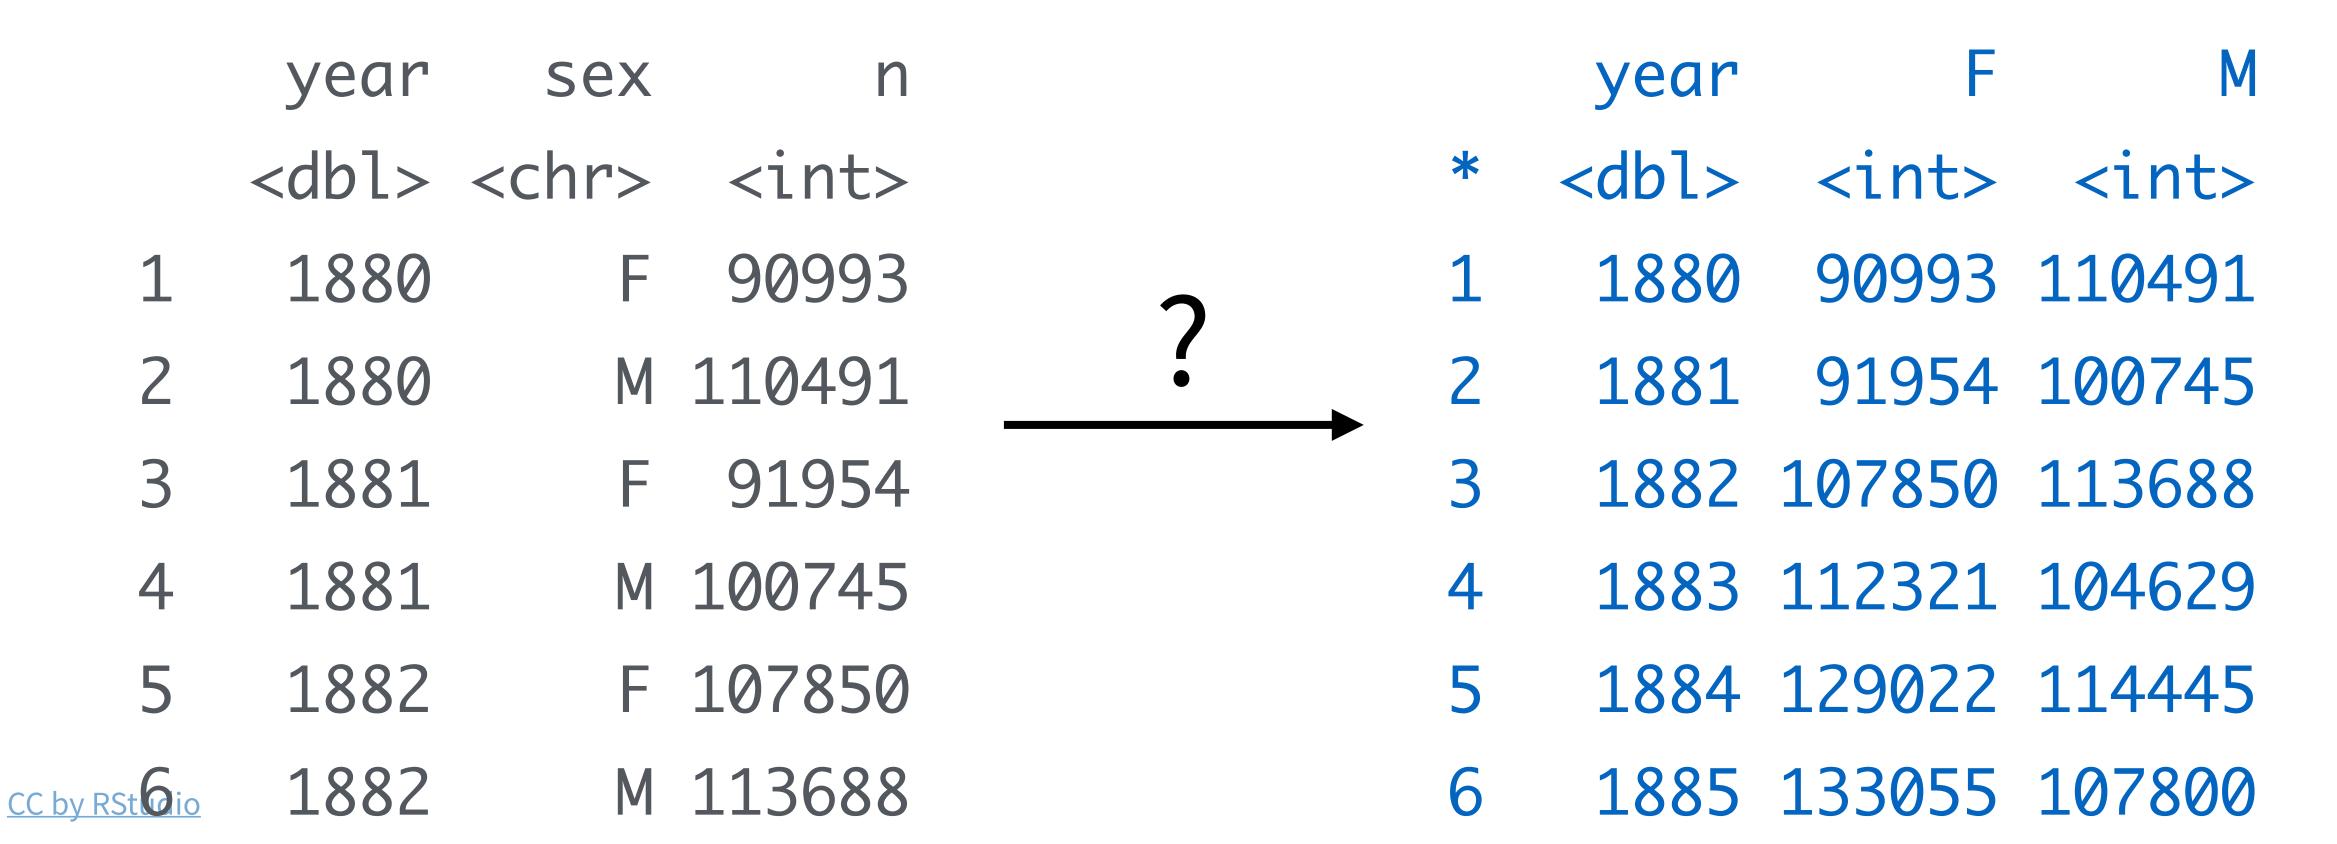

```
year

```

Now what?

Can we calculate the ratio of boys to girls?

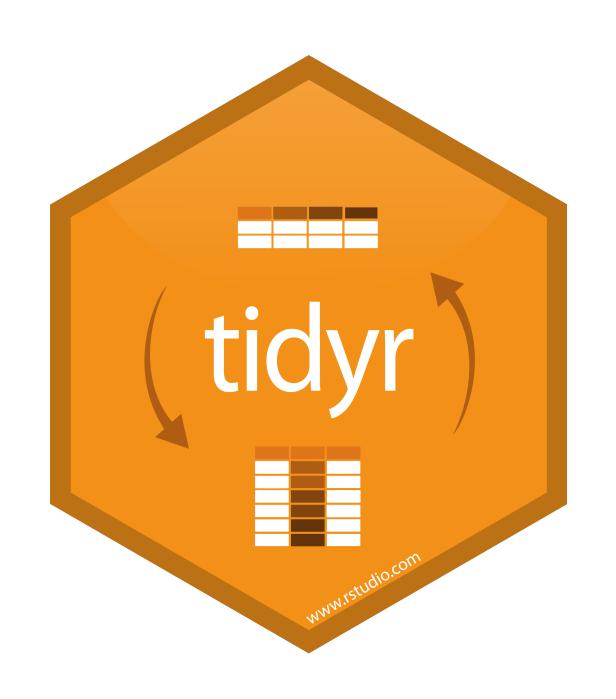

```
better_layout %>%
mutate(percent_male = M / (M + F) * 100)
```

tidyr

tidyr

A package that reshapes the layout of tabular data.

spread()

spread()

Generates multiple columns from two columns:

- unique values in the key column become column names
- values in the value column become cells in the new columns

spread(pollution, size, amount)

data frame to reshape

column to use for keys (new columns names)

column to use for values (new column cells)

spread(pollution, size, amount)

	city	size	amount		city	large	small
1	New York	large	23	1	Beijing	121	56

5	Beijing	large	121				
6	Beijing	small	56				

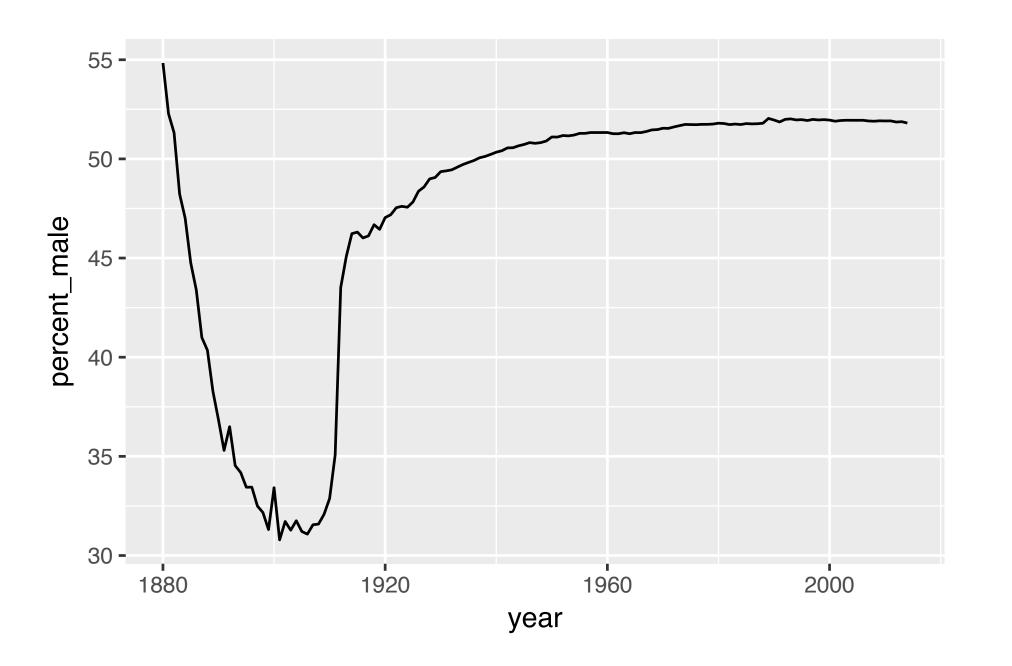

Your Turn

Reshape the layout of this data. Calculate the percent of male children by year. And then plot the percent over time.

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

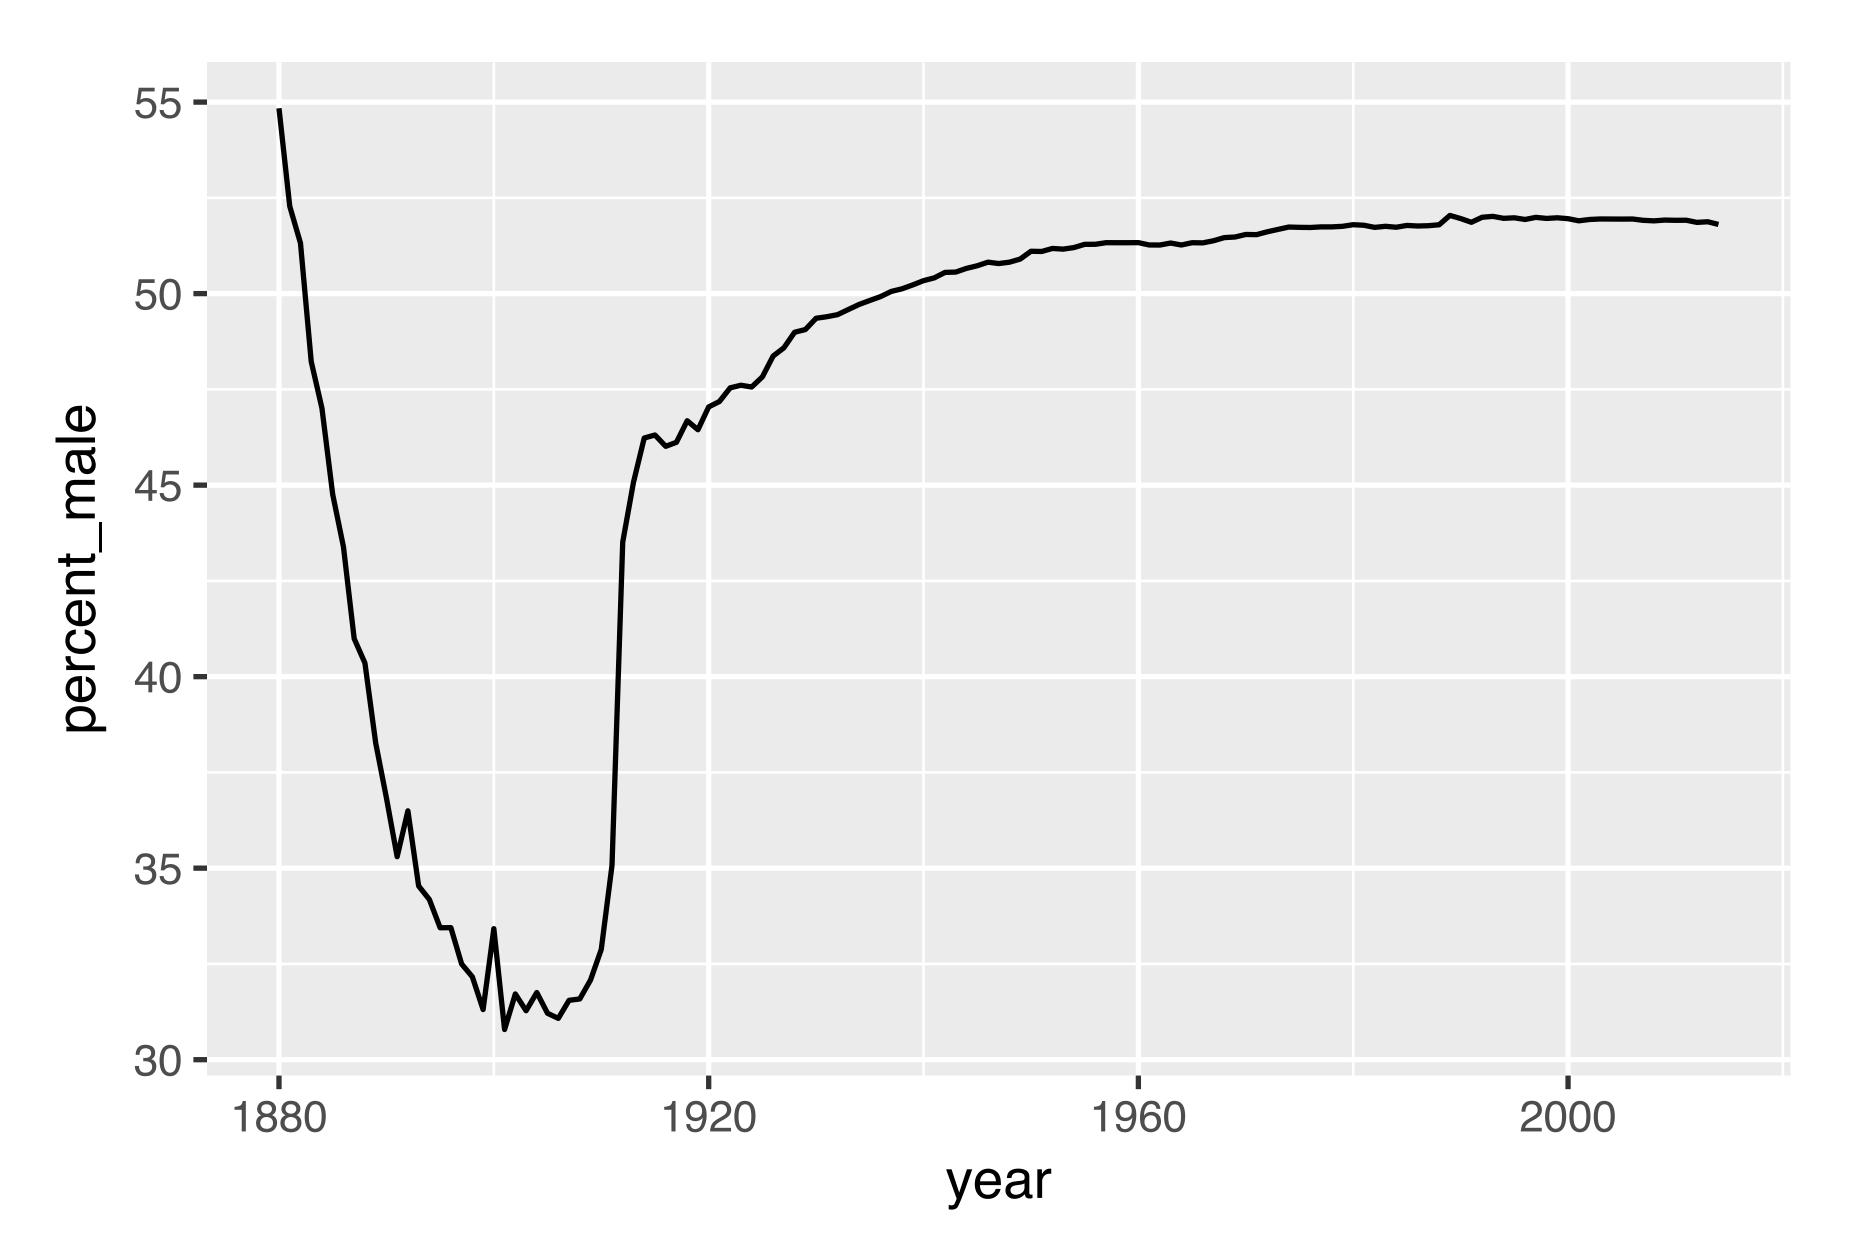

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n)) %>%
  spread(sex, n) %>%
  mutate(percent_male = M / (M + F) * 100) %>%
  ggplot(aes(year, percent_male)) + geom_line()
```

Percent of children that are male by year

Reshaping tables

spread() is one of a family of functions for reshaping tables.

- spread() move values into column names
- gather() move column names into values
- separate() separate variables that share a column
- unite() unite a variable that is split across several columns

Tidy Data

Tidy data

Tidy functions all expect and return the same data structure, known as **tidy data**:

- 1. A data frame that contains
- 2. variables in the columns and
- 3. cases in the rows.

Tidy data

A data set is **tidy** iff:

- Each variable is in its own
 column
- 2. Each case is in its own row

Your Turn

Gather the 5th through 60th columns of who into a key column: value column pair named codes and n.

Then select just the county, year, codes and n variables.

who %>%

gather("codes", "n", 5:60) %>%

select(-iso2, -iso3)

	country	year [‡]	code	s	÷	n	÷
1	Afghanistan	1980	new	sp_m	14		NA

separate()

Quiz

What variables are "hidden" here in plain sight?

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-13
Arthur	45	1010	1996-06-21

Quiz

What variables are "hidden" here in plain sight?

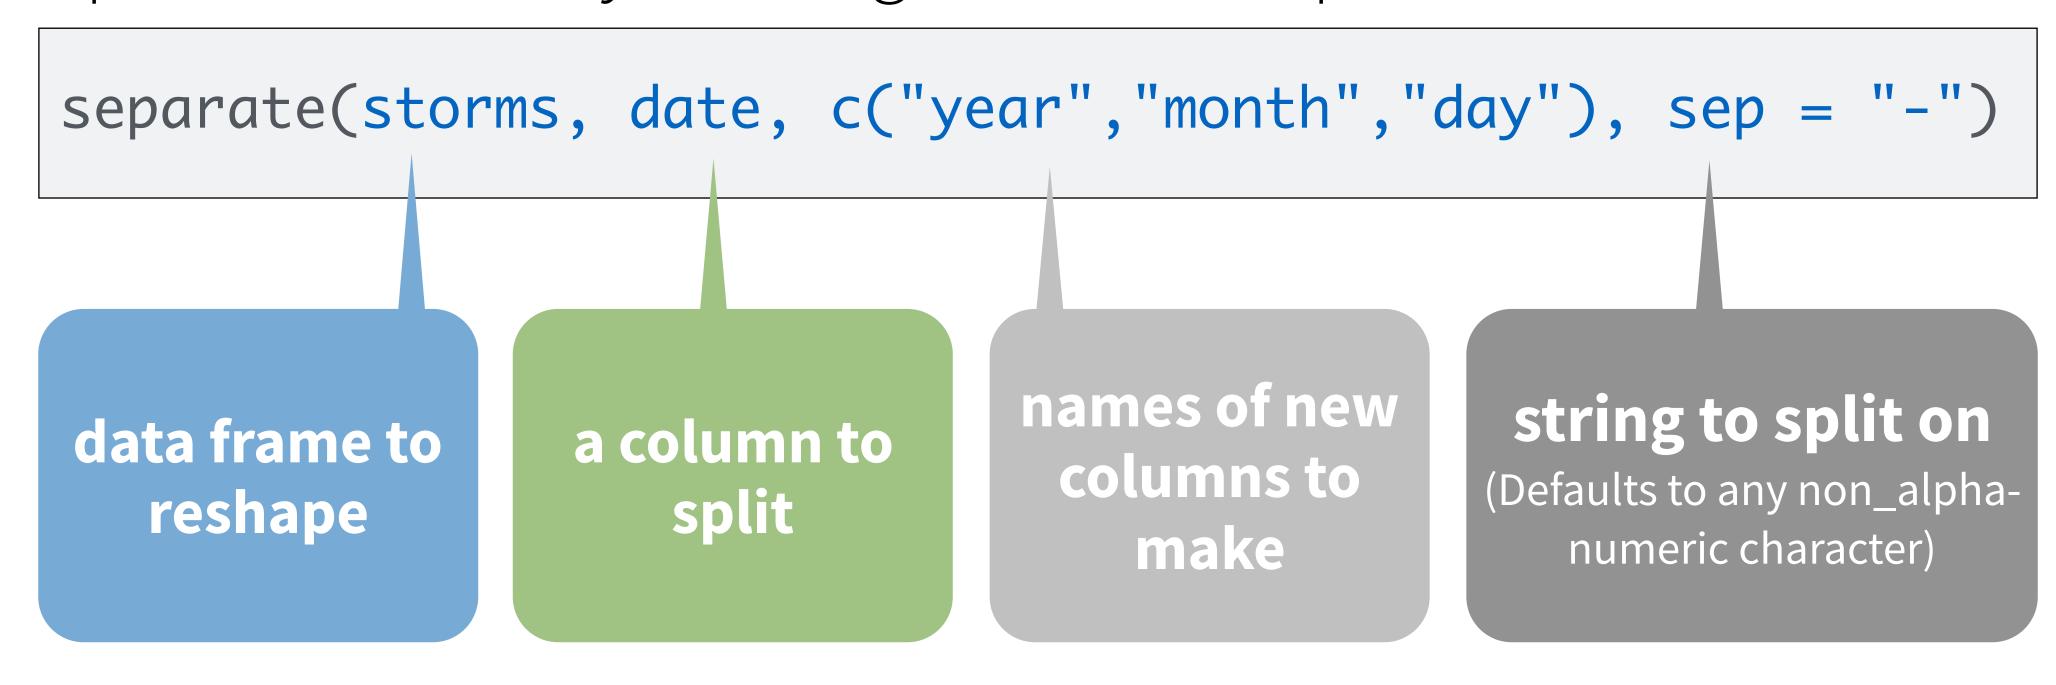

- year
- month
- day

storms

storm	wind	pressure	da.
Alberto	110	1007	2 00-08-12
Alex	45	1009	198-07-30
Allison	65	1005	195-06-04
Ana	40	1013	197-07-01
Arlene	50	1010	199-06-18
Arthur	45	1010	196-06-21

separate()

Splits a column by dividing values at a specific character.

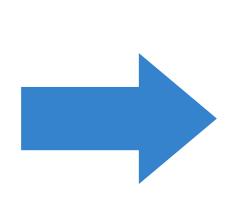

separate(storms, date, c("year", "month", "day"), sep = "-")

	storm	wind	pressure	date		storm	wind	pressure	year	month	day
1	Alberto		-	2000-08-03	1	Alberto	110	1007	2000	80	03

Converts
numeric
column names
to numbers

Your Turn

Separate the codes column into three columns at the underscores. Use the column names "new", "type", "sexage". Then select everything but the "new" column.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3) %>%
  separate(codes, c("new", "type", "sexage"), sep = "_") %>%
  select(-new)
```

	country	year [‡]	type [‡]	sexage [‡]	n [‡]
1	Afghanistan	1980	sp	m 014	NA
2	Afghanistan	1981	sp	m 014	NA
3	Afghanistan	1982	sp	m 014	NA
4	Afghanistan	1983	sp	m 014	NA
5	Afghanistan	1984	sp	m 014	NA
6	Afghanistan	1985	sp	m 014	NA
7	Afghanistan	1986	sp	m 014	NA
8	Afghanistan	1987	sp	m 014	NA
CC by RStudio	Afghanistan	1988	sp	m 014	NA
10	Afabanistan	1000	cn	m 014	AIA

separate()

Splits a column by dividing values at a specific character.

```
separate(storms, date, c("year", "rest"), sep = c(4,8))
```

locations to split at

(Split after 4th and 8th characters)

Your Turn

Separate the sexage column into sex and age columns.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3) %>%
  separate(codes, c("new", "type", "sexage"), sep = "_") %>%
  select(-new) %>%
  separate(sexage, c("sex", "age"), sep = 2)
```

	country	year [‡]	type [‡]	sex [‡]	age [‡]	n
1	Afghanistan	1980	sp	m	014	NA
2	Afghanistan	1981	sp	m	014	NA
3	Afghanistan	1982	sp	m	014	N
4	Afghanistan	1983	sp	m	014	N
5	Afghanistan	1984	sp	m	014	N
6	Afghanistan	1985	sp	m	014	N
7	Afghanistan	1986	sp	m	014	N
8	Afghanistan	1987	sp	m	014	N
y RStudio	Afghanistan	1988	sp	m	014	N
<u> 10</u>	Afabanistan	1000	6.10	100	014	A./

separate_rows()

Splits a column. Creates a new row for each result.

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-13
Arthur	45	1010	1996-06-21

	storm [‡]	wind [‡]	pressure	date [‡]
1	Alberto	110	1007	2000
2	Alberto	110	1007	8
3	Alberto	110	1007	3
4	Alex	45	1009	1998
5	Alex	45	1009	7
6	Alex	45	1009	27
7	Allison	65	1005	1995
8	Allison	65	1005	6
9	Allison	65	1005	3

unite()

unite()

Unites columns into single column by combining cells.

Your Turn

Use separate() and then unite() to change how storms codes date, as below.

storms

storm	wind	pressure	date
Alberto	110	1007	2000-08-12
Alex	45	1009	1998-07-30
Allison	65	1005	1995-06-04
Ana	40	1013	1997-07-01
Arlene	50	1010	1999-06-13
Arthur	45	1010	1996-06-21

storm	wind	pressure	date
Alberto	110	1007	08/12/2000
Alex	45	1009	07/30/1998
Allison	65	1005	06/04/1995
Ana	40	1013	07/01/1997
Arlene	50	1010	06/13/1999
Arthur	45	1010	06/21/1996

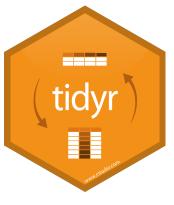

```
storms %>%
separate(date, c("year", "month", "day"), sep = "-") %>%
unite("date", month, day, year, sep = "/")
```

Missing Values

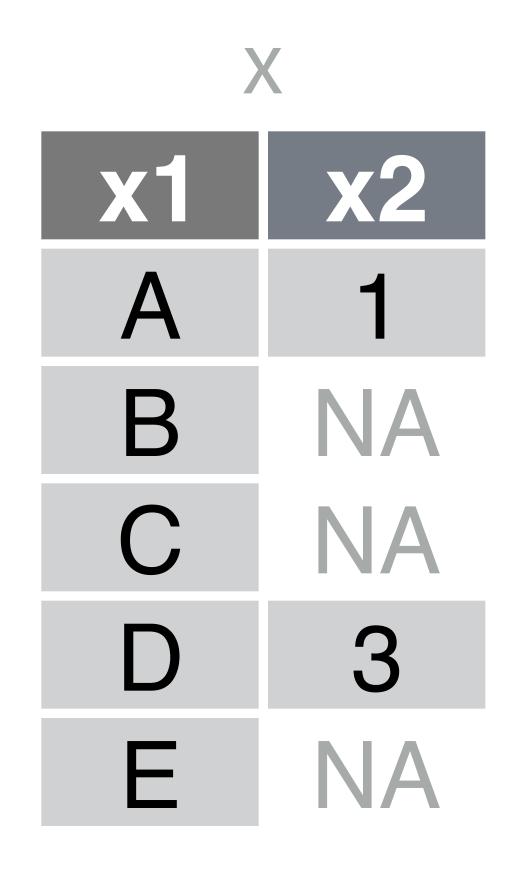

Can we clean up the missing values?

	country	year [‡]	type [‡]	sex [‡]	age [‡]	n [‡]
1	Afghanistan	1980	sp	m	014	NA
2	Afghanistan	1981	sp	m	014	NA
3	Afghanistan	1982	sp	m	014	NA
4	Afghanistan	1983	sp	m	014	NA
5	Afghanistan	1984	sp	m	014	NA
6	Afghanistan	1985	sp	m	014	NA
7	Afghanistan	1986	sp	m	014	NA
8	Afghanistan	1987	sp	m	014	NA
9	Afghanistan	1988	sp	m	014	NA
10	Afghanistan	1989	sp	m	014	NA
11	Afghanistan	1990	sp	m	014	NA
12	Afghanistan	1991	sp	m	014	NA
13	Afghanistan	1992	sp	m	014	NA

Toy data

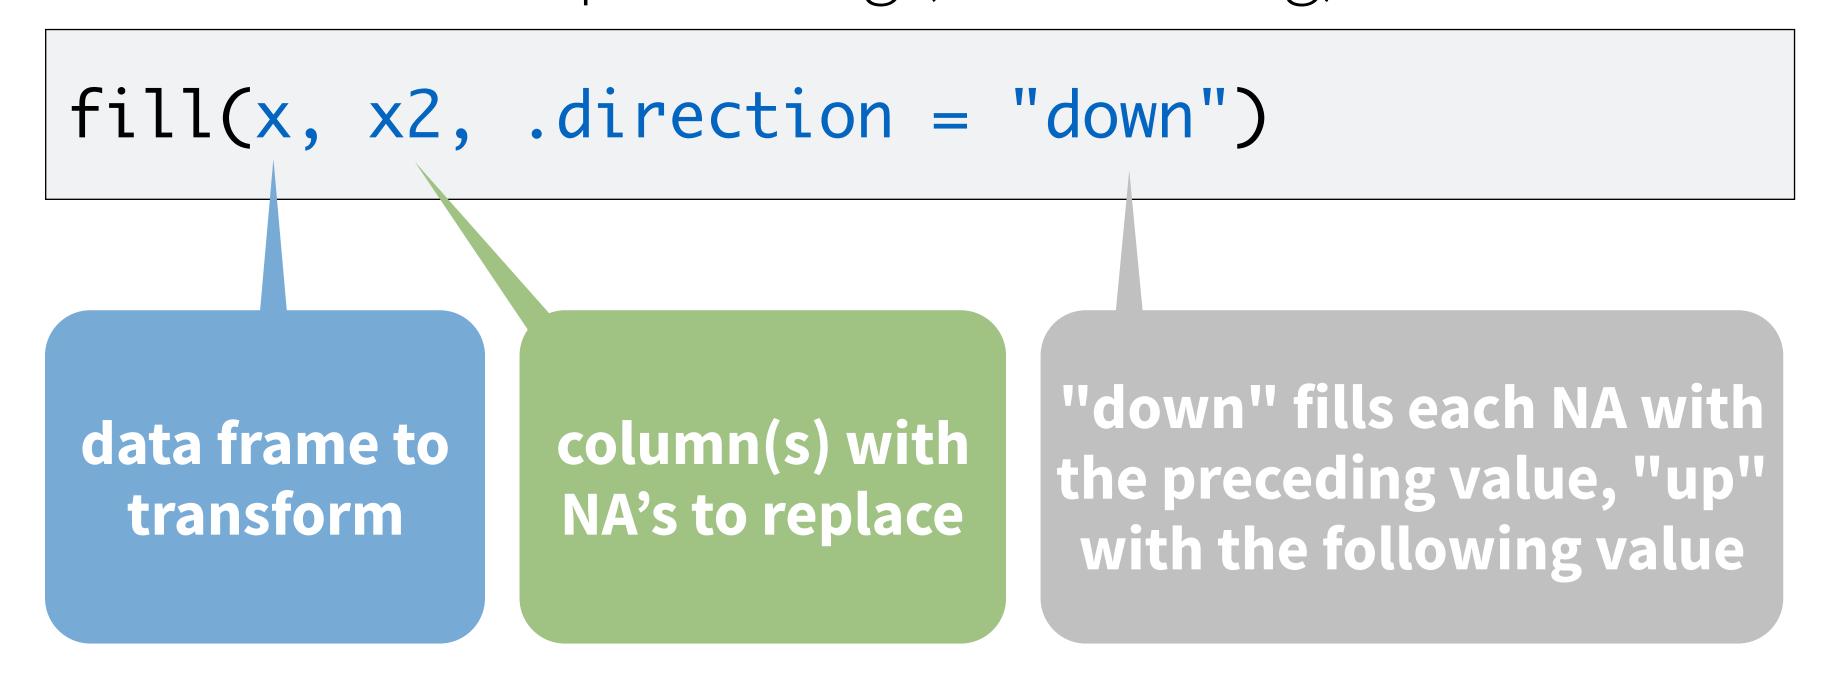

```
x <- tribble(
 ~x1, ~x2,
        NA,
        NA,
         NA
```

fill()

Fills in NA's with preceding (or following) values.

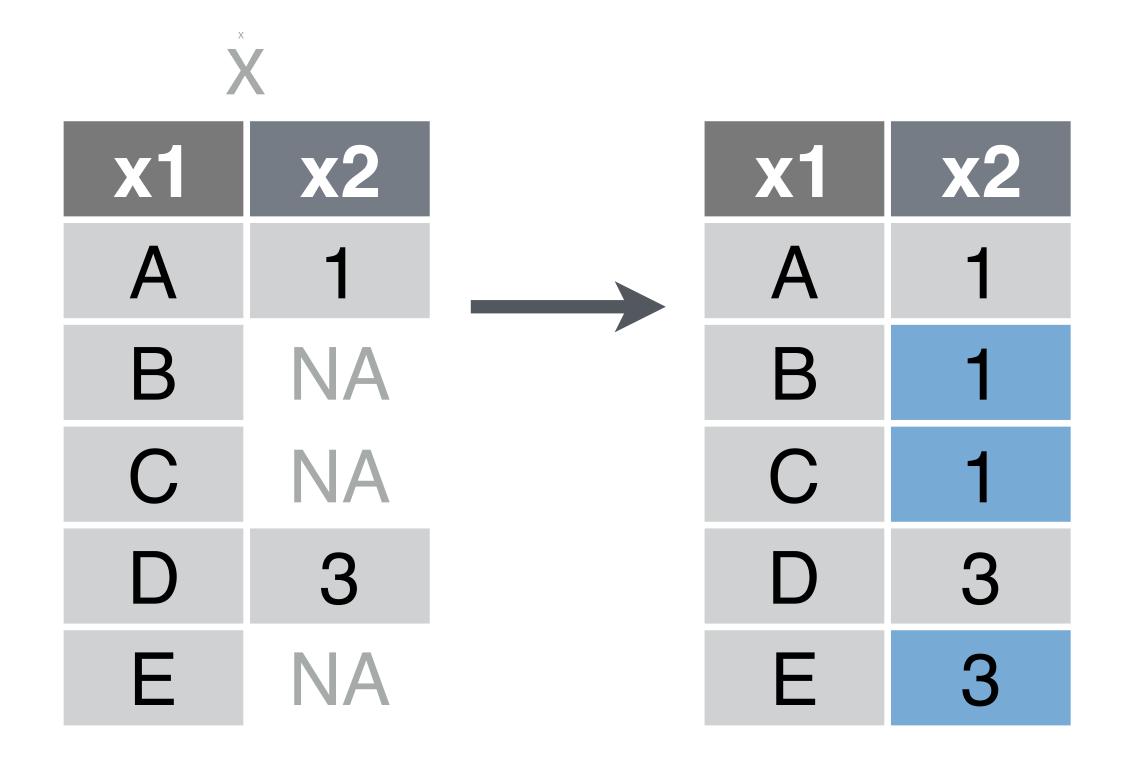

fill()

Fills in NA's with preceding (or following) values.

```
fill(x, x2, .direction = "down")
```

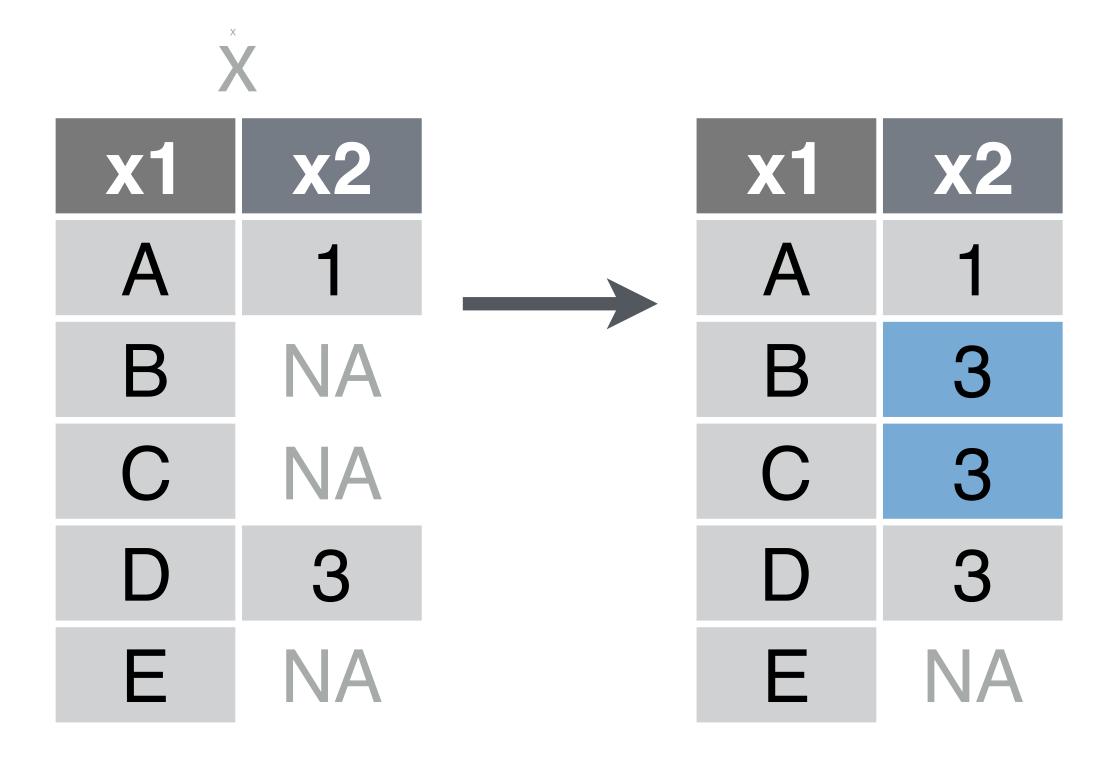

fill()

Fills in NA's with preceding (or following) values.

```
fill(x, x2, .direction = "up")
```

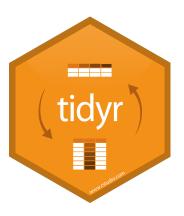

replace_na()

Replace NA's by column.

```
replace_na(x, replace = list(x2 = 2))
```

data frame to transform

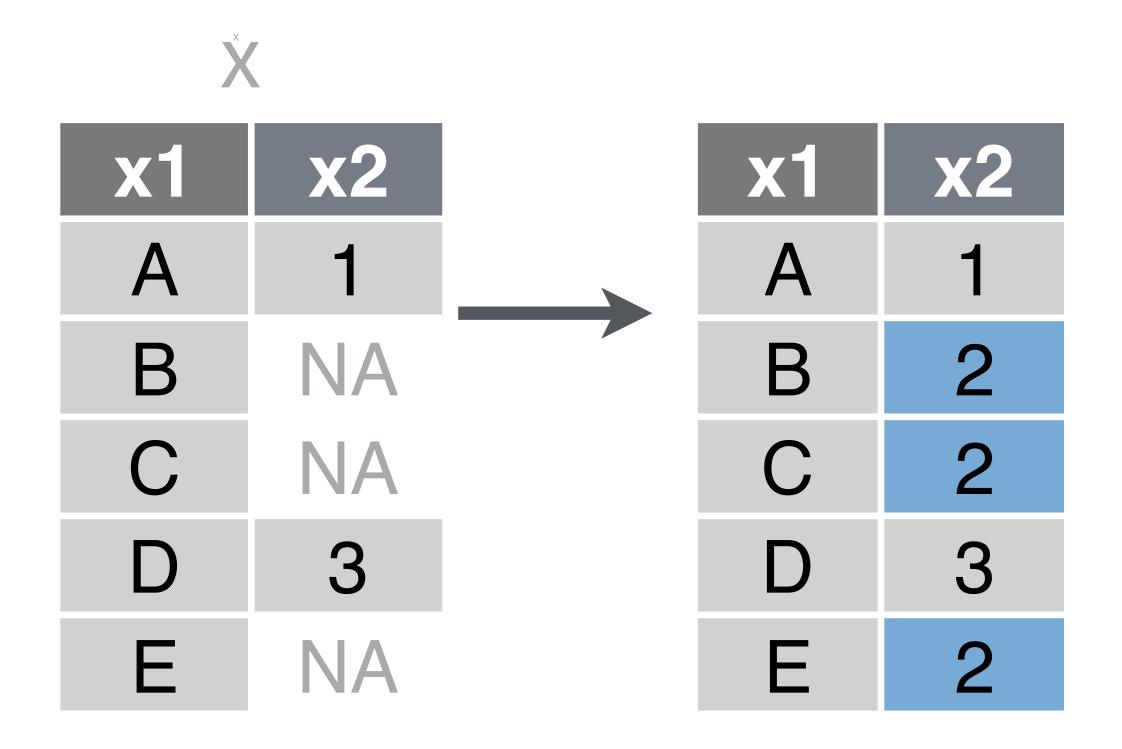

A named list of column names paired with values to replace NA's with.

replace_na()

Replace NA's by column.

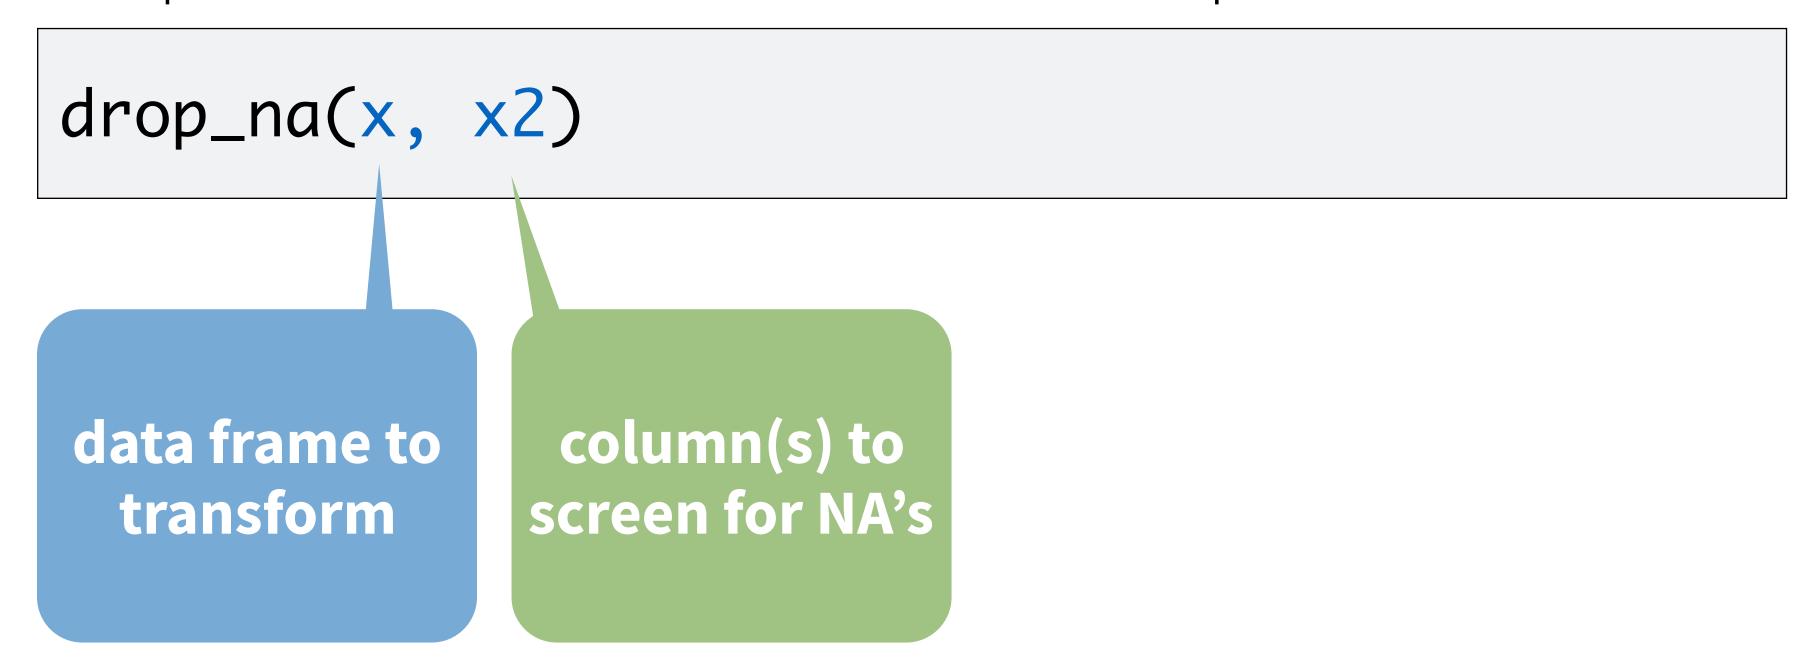

```
replace_na(x, replace = list(x2 = 2))
```

drop()

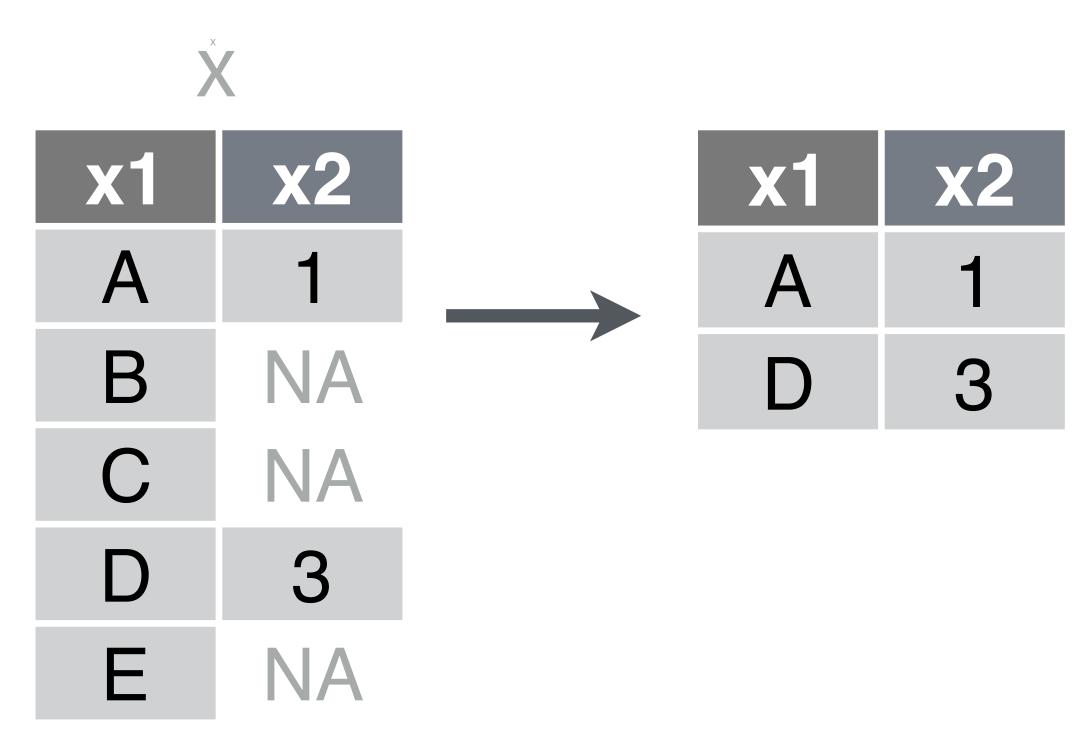

Drops rows that contain NA's in the specified columns.

drop_na()

Drops rows that contain NA's in the specified columns.

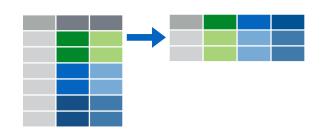

```
who %>%
  gather("codes", "n", 5:60) %>%
  separate(codes, c("new", "type", "sexage"), sep = "_") %>%
  select(-new, -iso2, -iso3) %>%
  separate(sexage, c("sex", "age"), sep = 2) %>%
  drop_na(n)
```

Recap

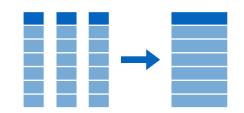

Move values into column names with spread()

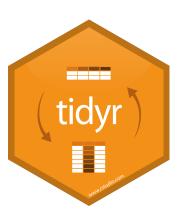

Move column names into values with gather()

Split a column with separate() or separate_rows()

Unite columns with unite()

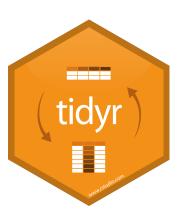

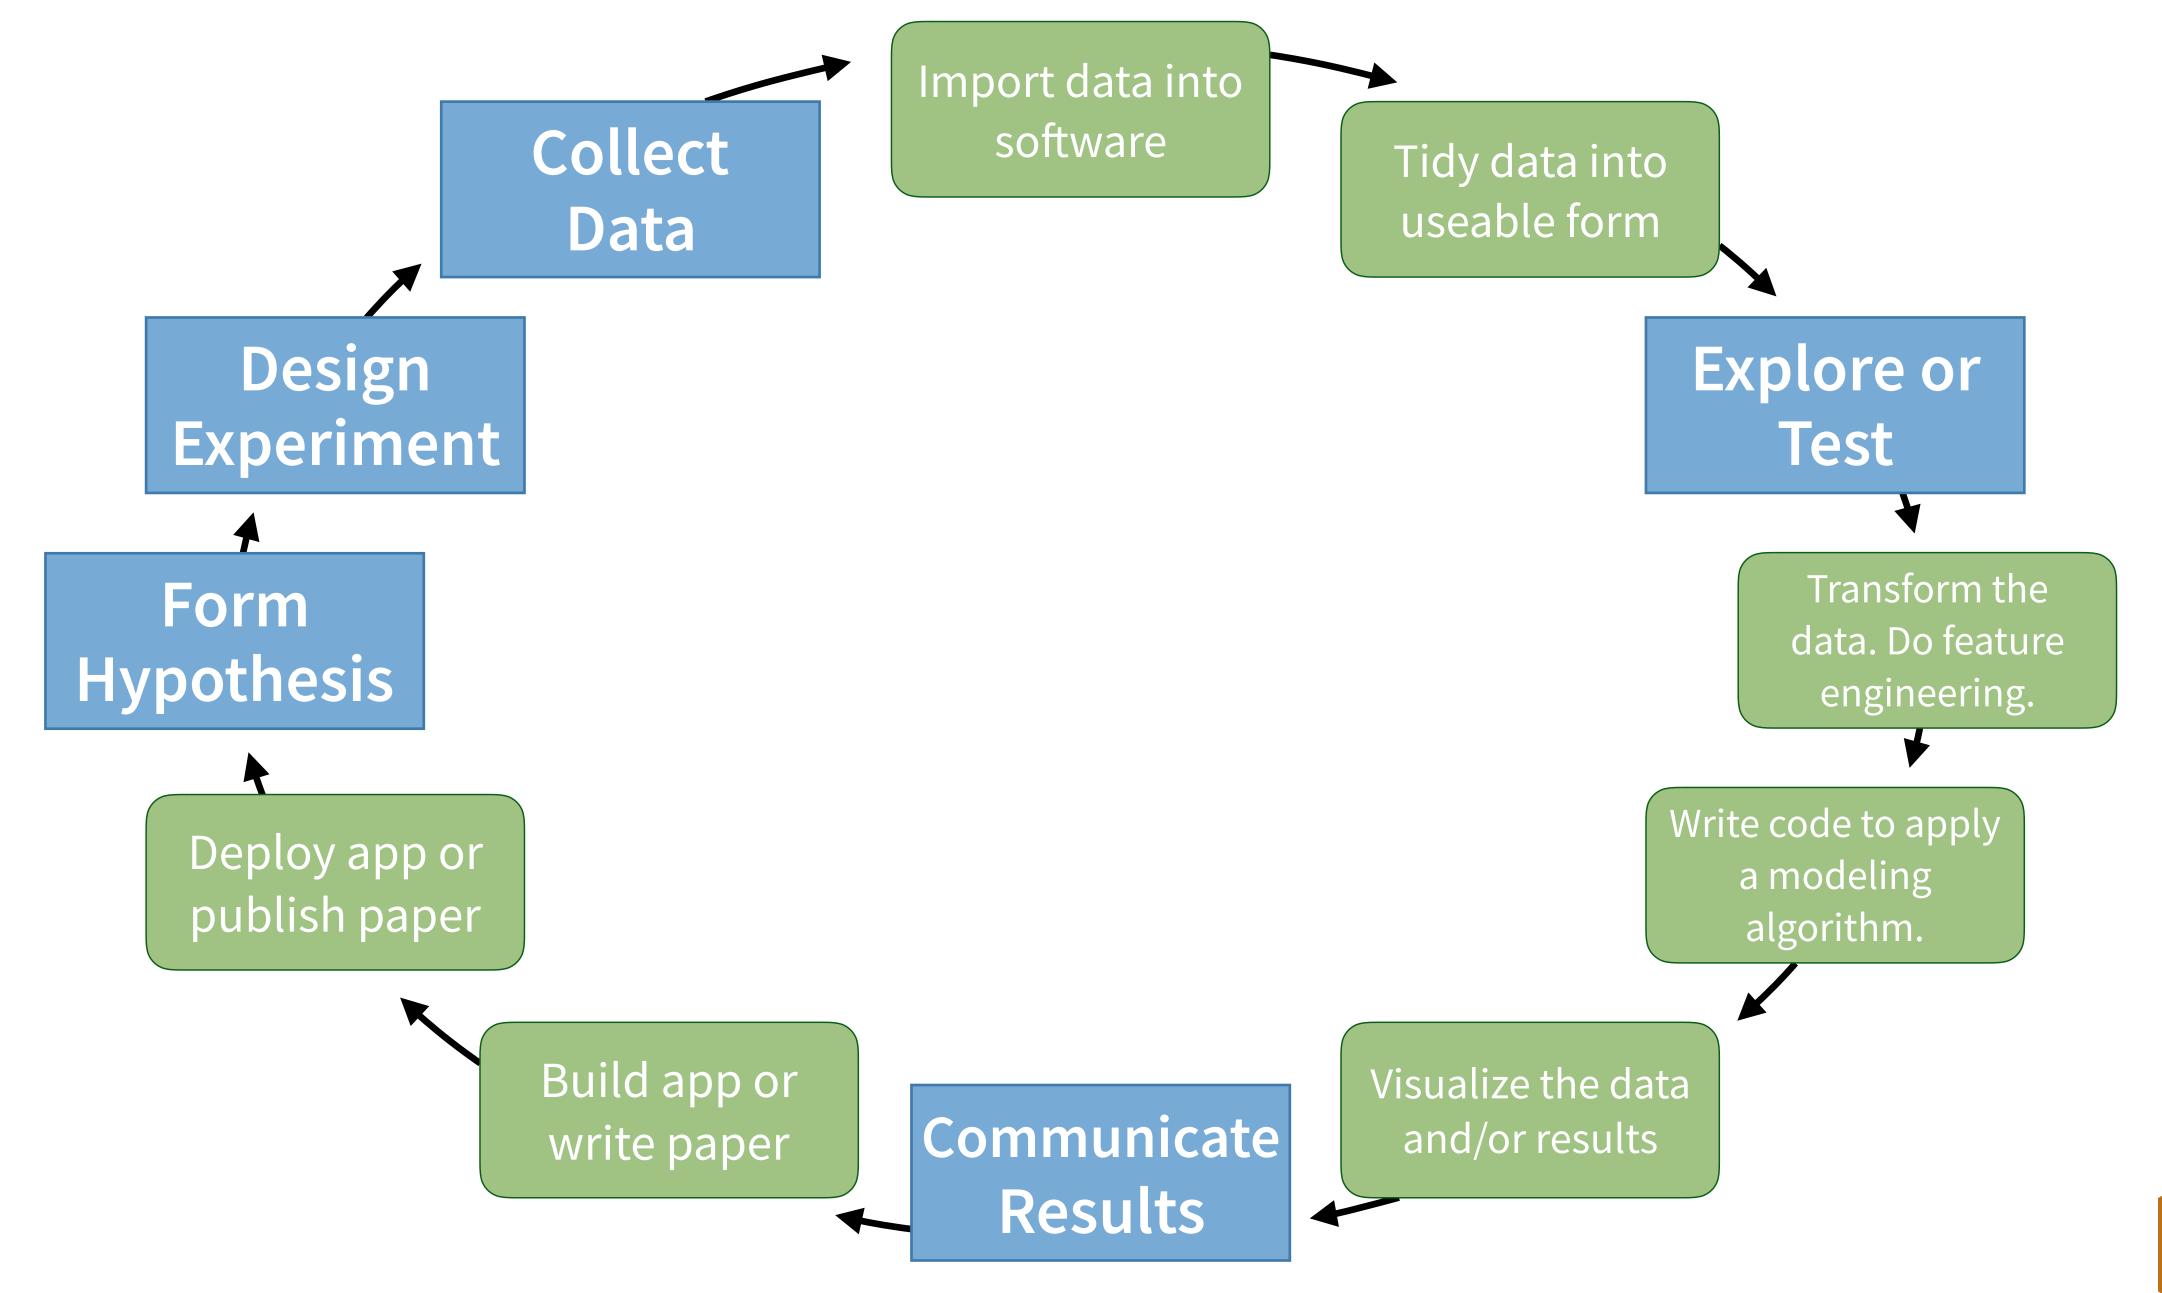

The role of tidy data in the tidyverse

Tidy data

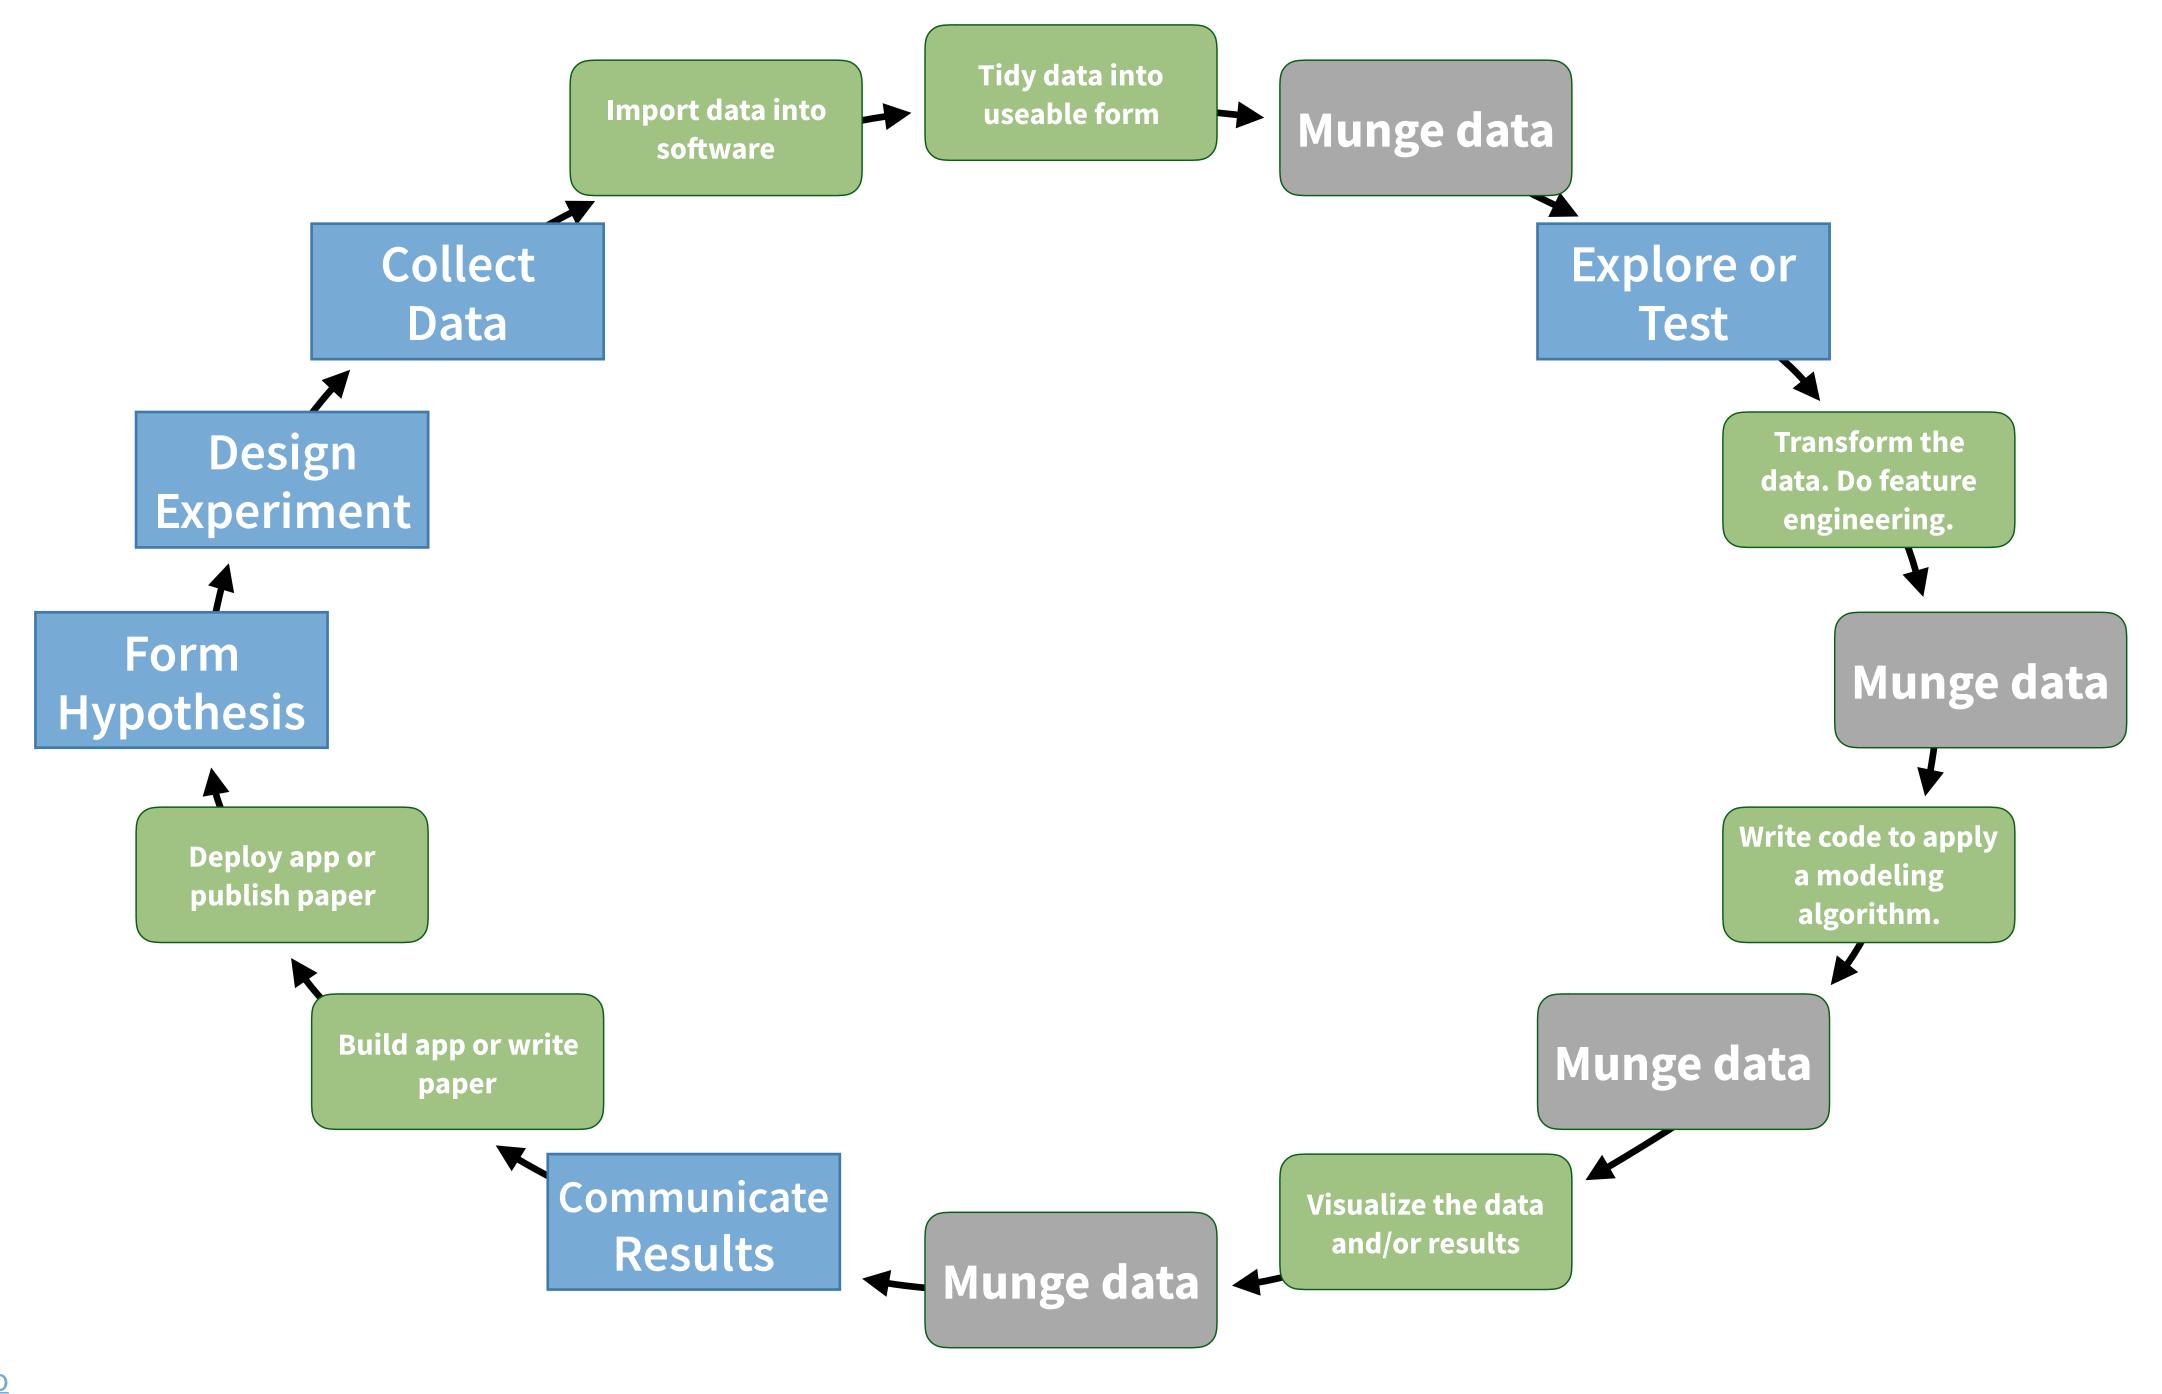

Tidy functions all expect and return the same data structure, known as tidy data:

- 1. A data frame that contains
- 2. variables in the columns and
- 3. cases in the rows.

Tidy data

Tidy functions all expect and return the same data structure, known as **tidy data**:

- 1. A data frame that contains
- 2. variables in the columns and
- 3. cases in the rows.

Which is tidy? What is a variable?

```
layout1 %>%
    ggplot(aes(year, n)) +
    geom_line(aes(color = sex))
```

```
layout2 %>%
mutate(pmale = M / (M + F))
```

```
year
               sex
       <dbl> <chr> <int>
              F 90993
        1880
               M 110491
        1880
             F 91954
        1881
        1881
                 M 100745
        1882
                 F 107850
        1882
                 M 113688
CC by RStu
```

```
year
  <dbl> <int> <int>
   1880 90993 110491
   1881 91954 100745
   1882 107850 113688
    1883 112321 104629
    1884 129022 114445
    1885 133055 107800
6
```

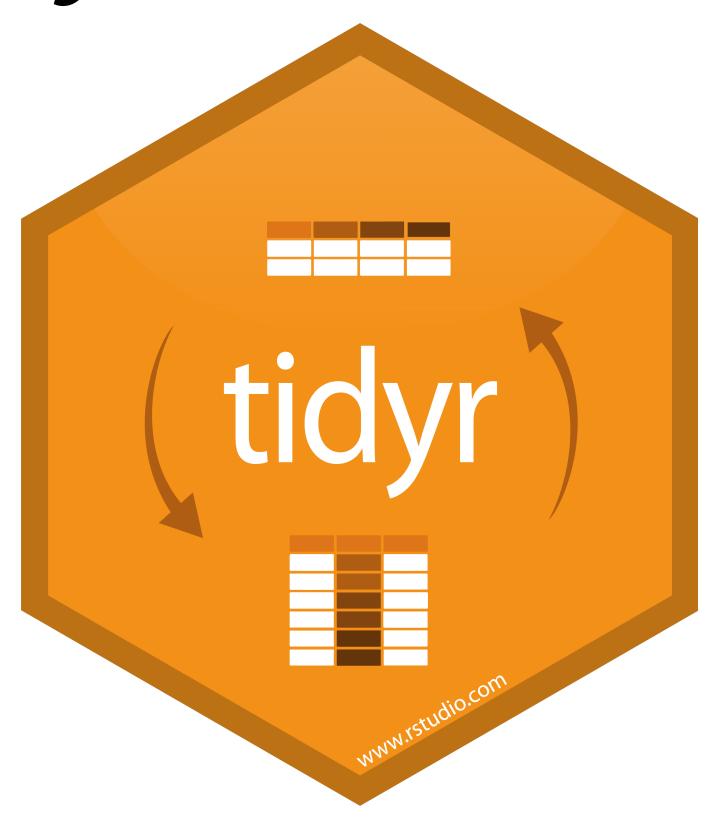

General advice

Describe what you want to do in an **equation**. Each variable in the equation should correspond to a variable in your data:

- "color by sex"color = sex
- "calculate the proportion of males"
 prop male = number of males / number of females + number of males

Tidy Data with

Reshaping Final Exam

"Tidy data sets are all alike; but every messy data set is messy in its own way."

- Hadley Wickham

Your Turn

In your grous, use spread(), gather(), separate(), and/or unite() to tidy each of the following tables:

- table2
- table3
- table4a does not contain population
- table4b does not contain cases
- table5

Unless otherwise specified, each contains a country, year, cases, and population variable.

```
table2 %>%
spread(type, count)
```

```
table3 %>%
  separate(rate, c("cases", "population"), sep = "/",
  convert = TRUE)
```

```
table4a %>%
  gather("year", "cases", 2:3, convert = TRUE)
```

```
table4b %>%
  gather("year", "population", 2:3, convert = TRUE)
```

```
table5 %>%
unite("year", century, year, sep = "") %>%
separate(rate, c("cases", "population"), sep = "/",
    convert = TRUE)
```
